

**DECOMPOSING WORLD-WIDE SO<sub>2</sub>  
EMISSIONS 1990-2000**

**IS TRADE BAD FOR THE ENVIRONMENT?**

**Jean-Marie Grether, University of Neuchâtel  
Nicole Andréa Mathys, University of Lausanne  
Jaime de Melo, University of Geneva**

# ISSUES

- **Decrease in world-wide SO<sub>2</sub> emissions in the 90s**
- **Why?**
  - more abatement activity, including in South
  - collapse of former Soviet Union
  - 1997 crisis in East Asia
- **Opposite force:**
  - scale effect
- **Ambiguous force:**
  - trade (pollution-haven effect vs. factor-endowment effect)?
- **Lack of data ⇒ difficult to:**
  - disentangle those forces
  - estimate the role of trade

## THIS PAPER

- **original combination of data on manufacturing**  
⇒ **emission intensities at the country and sector level**
- **comprehensive decomposition of growth in emissions**  
⇒ **scale, composition and technical effects**
- **construction of a simple no-trade benchmark**  
⇒ **impact of trade on world emissions**

# OUTLINE

**I. STYLIZED FACTS**

**II. GROWTH DECOMPOSITION**

**III. IMPACT OF TRADE**

# STYLIZED FACTS: (1) DECREASE IN EMISSIONS

# STYLIZED FACTS: (2) CLEANER PRODUCTS?

## STYLIZED FACTS: (3) CLEANER COUNTRIES?

## STYLIZED FACTS: (4) CLEANER TECHNOLOGIES?

## STYLIZED FACTS: SUMMARY

- emissions ↓ while employment and output ↑
- share of dirty products ↓ or →
- share of South in labor manufacturing ↑
- emission intensities ↓ world-wide
- emission intensities per unit labor are very similar between North and South

⇒ orders of magnitude = ?...

# GROWTH DECOMPOSITION FRAMEWORK

**World emissions ( $E_{..}$ ):**  $E_{..} = \sum_k \sum_i \gamma_{ki} L_{ki}$

( $L$ : labor,  $\gamma$ : emission intensity)

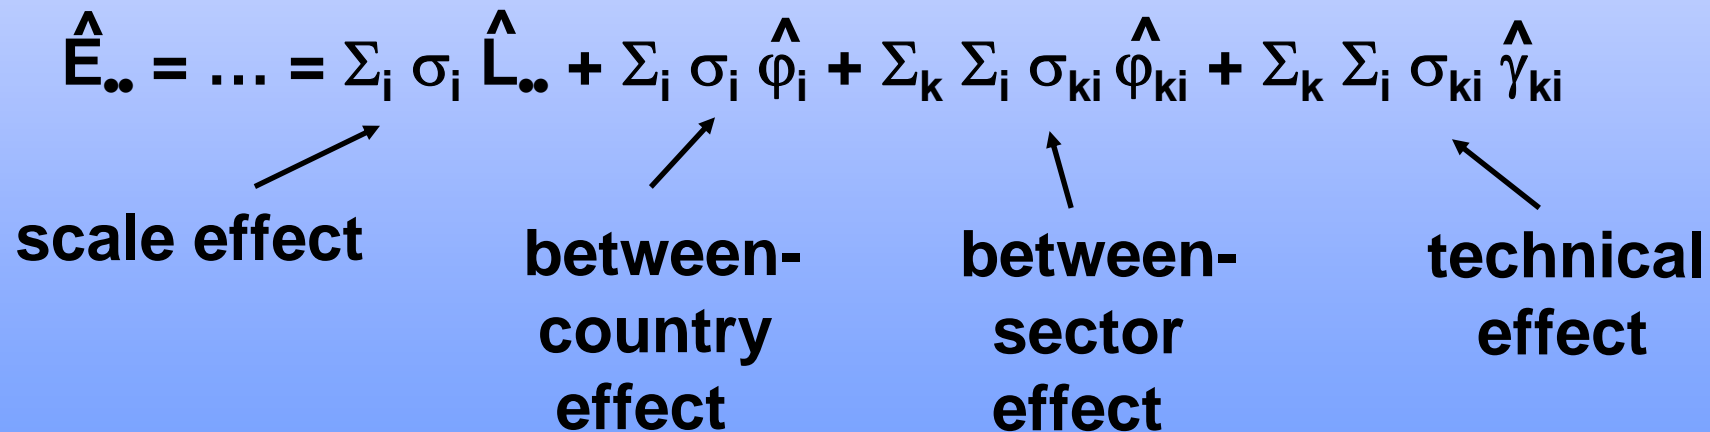

**Growth decomposition ( $\hat{\phantom{x}}$  means growth rate):**

$\sigma_i, \sigma_{ki}$ : emissions shares

$\varphi_i, \varphi_{ki}$ : labor shares

$$\hat{E}_{..} = \dots = \sum_i \sigma_i \hat{L}_{..} + \sum_i \sigma_i \hat{\varphi}_i + \sum_k \sum_i \sigma_{ki} \hat{\varphi}_{ki} + \sum_k \sum_i \sigma_{ki} \hat{\gamma}_{ki}$$

scale effect      between-country effect      between-sector effect      technical effect

## DATA SOURCES

- **Sources**
  - emission intensities at sector level : World Bank IPPS (Hettige et al, 1995), **only valid for the US in 1987**
  - emissions national level: Stern (2006) and Olivier & and Berdowski (2006 – Edgar)
  - trade, production, employment: World Bank, Trade & Production database, Nicita and Olarreaga (2006)
- **Data sample**
  - 62 countries – 6 regions
  - 28 ISIC 3digit sectors
  - 3 years: 1990, 1995, 2000

## SIMILARITY OF INTENSITIES PER UNIT LABOR

- Hettige et al (2000): panel of 11 countries: intensities per dollar vary widely but intensities per unit labor are roughly constant
- This paper: reconstruction of Chinese IPPS intensities and comparison with US ones: rank correlation larger than 0.9 for per unit labor intensities (between 0.7 and 0.9 for per dollar intensities)
- This paper: cf. North-South stylized facts above: average intensities per unit labor are **very similar**, large differences for per unit dollar values

⇒ assume **identical** per unit labor intensities across regions and years, except for a **conversion ratio** that matches reported emissions with calculated ones

## OBTENTION OF EMISSION INTENSITIES

- i. aggregate 62 countries in 6 regions
- ii. apply the (original IPPS) US per labor intensities and combine with labor to obtain total **calculated** emissions per year and region,  $CE_{it}$
- iii. use Stern data to obtain total **effective** emissions per year and region,  $EE_{it}$
- iv. calculate the conversion ratio,  $R_{it} = EE_{it} / CE_{it}$
- v. apply the conversion ratio to US IPPS intensities to obtain region and year specific intensities,  
 $\gamma_{kit} = \gamma_{k,US} * R_{it}$

# GROWTH DECOMPOSITION: TOTALS

## GROWTH DECOMPOSITION: BY REGION

	Total net effect (1)+(2) +(3)+(4)	Total gross effect  (1) + (2)  + (3) + (4)
World <sup>a</sup>	-9.91	
<b>Share in total gross effect:<sup>b</sup></b>		
Asian High Income	-2.3	6
Europe	-21.7	28.5
North America	-4.2	10
Africa	-0.4	5.3
Asian Low Income	3	35
South America	7.4	15.3

## GROWTH DECOMPOSITION: BY SECTOR

	Total net effect (1)+(2) +(3)+(4)	Total gross effect  (1) + (2)  + (3) + (4)
<b>Share in total gross effect:<sup>b</sup></b>		
Food products	0.2	3.6
Beverages	0.5	1.5
Textiles	-0.6	1.2
Paper and products	-0.5	7.2
Industrial chemicals	-6.8	14
Other chemicals	-0.3	2.3
Petroleum refineries	-15.2	23.8
isc. petroleum and coal products	-2.4	4.1
ier non-metallic mineral products	8.3	13.8
Iron and steel	-6.1	13.8
Non-ferrous metals	-0.7	9.7
Machinery electric	-0.6	1
Transport equipment	-0.2	0.5

## GROWTH DECOMPOSITION: SUMMARY

- **scale effect: +1% a year**
- **technical effect: -1% a year**
- **composition effects: negative, combined: -1% a year**
- **strong compensating forces in Low Income Asia: becoming larger but also structurally cleaner**
- **petroleum refineries, industrial chemicals and iron&steel are loosing importance**

**⇒ what about trade ?...**

## TRADE IMPACT: A SIMPLE FRAMEWORK

**Key idea: trade allows for a redistribution of worldwide production (composition effect)**

**Assumption:** consumption unchanged  $\Rightarrow$  autarky simply means producing all consumed products at home

$\Rightarrow$  shift from autarky to trade means:

- more emissions because of exports
- less emissions because of imports

$\Rightarrow$  at the disaggregated level the change in emissions is:

$$\Delta E_{ki} = g_{ki} (X_{ki} - M_{ki})$$

$g_{ki}$ : per dollar intensity ( $g_{ki} = \gamma_{ki} / \Pi_{ki}$  where  $\Pi_{ki}$  is labor productivity)

$\Rightarrow$  aggregation...

## TRADE IMPACT: TWO SIMPLE FORMULAS

At the country level:

$$\Delta E_i = g_i^X X_i - g_i^M M_i \quad (1)$$

$g_i^X(g_i^M)$ : average intensity  
in exports (imports)

**Interpretation:** trade leads to an increase in emissions if exports are dirtier than imports on average.

At the sector level ( $M_k = X_k$ ,  $n$ : number of countries):

$$\Delta E_k = nM_k \text{cov}(\eta_{ki}, g_{ki}) \quad (2)$$

$\eta_{ki}$ : net export share of  
country  $i$  in world imports

**Interpretation:** trade leads to an increase in emissions if the largest net exporters are also the dirtiest producers (**pollution-haven** effect).

⇒ results...

## TRADE IMPACT: BY REGION

1990		Changes in emissions with respect to autarky	
Region	Level	Share in autarky emissions (%)	
High Income Asia	-74.64	-0.44	
Europe	41.51	0.25	
North America	41.01	0.24	
Africa	92.72	0.55	
Low Income Asia	-503.99	-2.99	
South America	107.88	0.64	
World	-295.51	-1.75	
<i>(World-2000)</i>	<i>-388.19</i>	<i>-2.52</i>	

## TRADE IMPACT: BY SECTOR

1990		Changes in emissions with respect to autarky	
Sector	Level	Share in autarky emissions (%)	
Paper and products	-39.73	-0.24	
Industrial chemicals	-264.48	-1.57	
Petroleum refineries	46.79	0.28	
Iron and steel	-78.32	-0.46	
Non-ferrous metals	43.01	0.25	
Machinery except electrical	-20.78	-0.12	
...	...	...	
<b>Total</b>	<b>-295.50</b>	<b>-1.75</b>	
<b>(Total-2000)</b>	<b>-388.20</b>	<b>-2.52)</b>	

## CONCLUSIONS AND LIMITATIONS

- **contribution of trade seems positive because:**
  - the between-country effect is small and negative
  - rough estimates suggest that trade reduces emissions by roughly 2% with respect to a no-trade situation
- **Limitations – further work**
  - control for transport-embodied emissions
  - control for resource constraints in the simulations

# CLEANER TECHNOLOGIES?

average intensities per US dollar

average intensities per unit labor
